-!- FUNCTION: Omega-conotoxins act at presynaptic membranes, they bind and block voltage-sensitive calcium channels (VSCC). This toxin blocks N-type calcium channels.
-!- SUBCELDIARE LOCATION: Secreted.
-!- SUBCELDIARE LOCATION: Secreted.
-!- PHARMACEUTICAL: Is under clinical trial by Neurex. It blocks acute pain in patients who no longer obtain relief from opiate drugs. It is 100 to 1000 times more potent than morphine. By blocking calcium channels it disable nerves that transmit pain signals.
-!- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STRUCTURE BY NMR.

J. Biol. Chem. 275:35335-35344 (2000).
-!- FUNCTION: Omega-conotcains act at presynaptic membranes, they bin and block voltage-sensitive calcium channels (VSCC) (By similarity). This toxin blocks N-type calcium channels.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- SIMILARITY: Belongs to the conotoxin O-superfamily. Omega-type
                                                                                                                                                                                                                                                       Gaps

"Chromatin condensation, cysteine-rich protamine, and establishment of disulphide interprotamine bonds during spermiogenesis of Bledone cirrhosa (Cephalopoda).",

Bur. J. Cell Biol. 81:341-349(2002).

-I-FUNCTION: Protamines substitute for histones in the chromatin of sperm DNA into a highly condensed, stable and inactive compact sperm DNA into a highly condensed, stable and inactive complex. This protamine condenses spermiogenic chromatin in a pattern which comprises fibres with a progressively larger diameter and lamellae that finally undergo definitive coalescence.

-I-SUBUNIT: Cross-linked by, interchain disulfide bonds around the
                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

RC STRAINBAISTOOLNA.

RC STRAINBAISTOOLNA.

RC STRAINBAISTOOLNA.

RU WormBase Consortium,

Submitted (SEP-2004) to the EMBL/GenBank/DDBJ databases.

CC -1- SUBELLULAR LOCATION: Nuclear (By similarity).

-1- SINLIARITY: Belongs to the nuclear hormone receptor family.

-i-TISSUE SPECIFICITY: In fetal tissues most abundant in spleen, brain stem and lung. Also present in most adult tissues where it is found mainly in lymphoid tissues.

-i- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteclytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNP-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright.                           SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity). Interacts with DTX1 and DTX2.
SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PTM: Phosphorylated (By similarity).
DISEASE: NOTCH1 truncation is associated with T-cell acute
both CD4+ and CD8+ cells in the thymus (By similarity)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3D-structure; Activator; ANK repeat; Developmental protein; Differentiation; EGF-like domain; Glycoprotein;

Development 130:4363-4373(2003).
-!- FUNCTION: Plays a central role in cell polarity establishment.
Participates in the assembly, positioning and maintenance of adherens junctions via its interaction with the SAC complex.
Controls the coalescence of the spots of zonula adherens (2A) into a adhesive ring around the cells. It may act as a signal. Involved in morphogenesis of the photoreceptor rhabdomere, for positioning and growth of rhabdomere and AJ during the crucial period of photoreceptor extension along the proximodistal axis of the
                                                                                                                                                                                                                                                                                                MEDLINE=99200394; PubMed=10102271; DOI=10.1016/S0092-8674(00)80593-0; Bhat M.A., Izaddoost S., Lu Y., Cho K.-O., Choi K.-W., Bellen H.J.; "Discs Lost, a novel multi-PDZ domain protein, establishes and maintains epithelial polarity."; cell 96:833-845(1999).

May interact with the par-6 complex, which is composed of par-6, baz and aPKC, via its interaction with Patj. Interacts with other proteins with Patj and sdt via its short cytoplasmic tail.
-!- SUBCELLUIAR LOCATION: Type I membrane protein. Specifically localized to the apical membrane.
-!- PTM: Phosphorylated in the cytoplasmic domain (Potential).
-!- SIMILARITY: Contains 3 laminin G-like domains.
